Community Health

Assessment

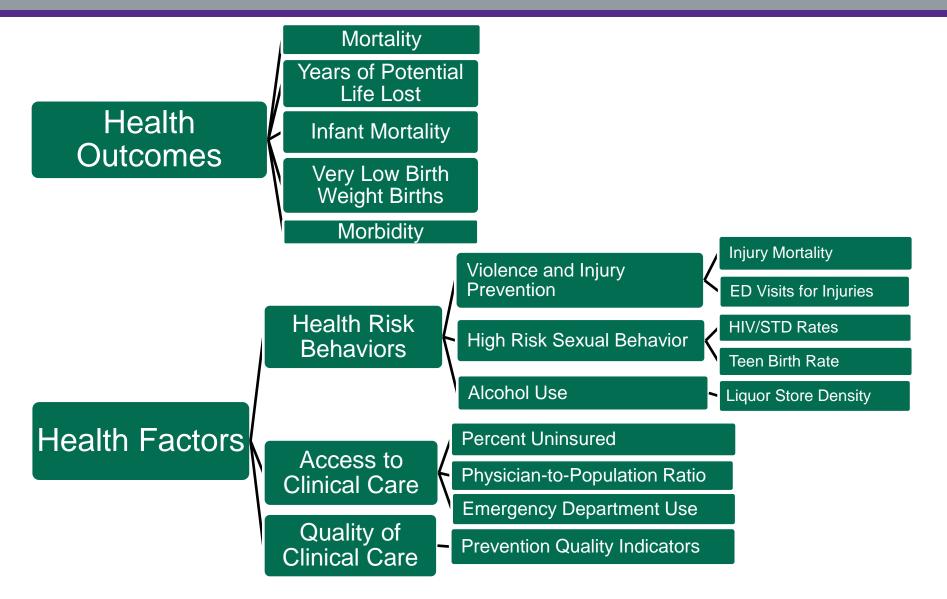

North Dallas Service Area

Organizational Model For the Community Health Dashboard

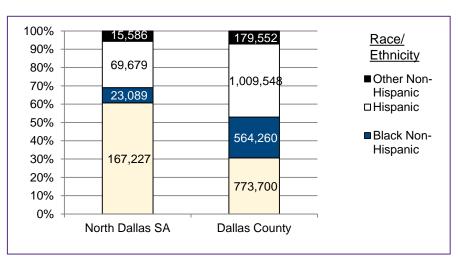

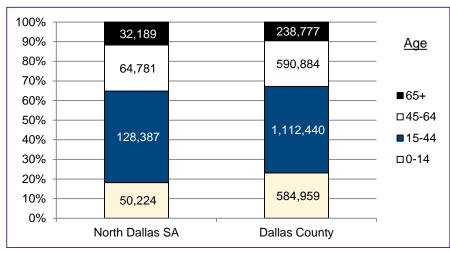

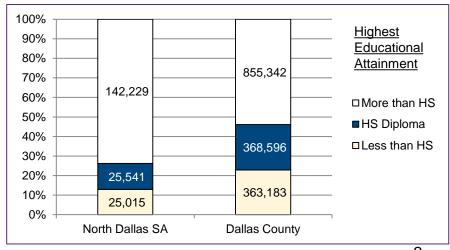

Demographic Profile

North Dallas Service Area, 2012

- The population of the North Dallas Service Area is older (11.7% age 65 and over) than the county population (9.5% age 65 and over).
- The service area is one of the three Dallas County service areas that is majority white (60.7%).
- The North Dallas Service Area has the second highest percentage of people age 25 and older with a high school education or more (73.8%) of the 13 service areas.

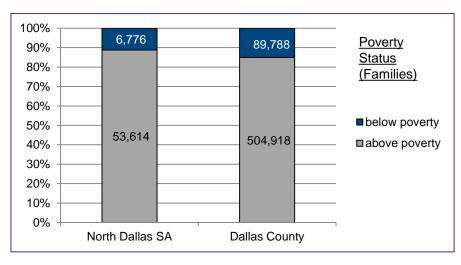

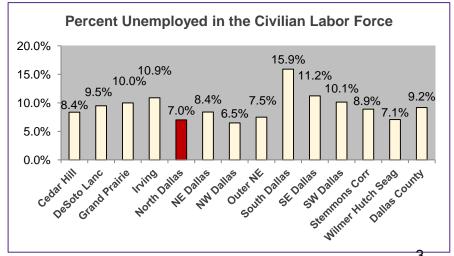

Demographic Profile

North Dallas Service Area, 2011

- The North Dallas Service Area has a lower percentage of families in poverty (11.2%) than Dallas County as a whole (15.1%).
- The Service Area's per capita income (\$47,766) was the highest of the 13 service areas.
- This Service Area ranks third in unemployment compared to the other 13 Service Areas.

Summary – Model With Stoplight Pie Charts, North Dallas Service Area

Parkland Deviations from the Dallas County mean

NOTE: All data are from the years 2009-2012, years available varies by topic.

Percent Difference from the Dallas County Average

Mortality VLBW ■ High Risk Sexual Behavior ■ Socioeconomic ■ YPLL Morbidity Access to Clinical Care Infant Mortality Violence and Injury ■ Preventable Hospitalizations

Methods of calculating deviations from the Dallas County mean for the preceding chart

- Mortality. For each service area and for Dallas County, add the 2011 age-adjusted death rates per 100,000 for the five leading causes of death, to get a single number. Calculate for each service area the percent deviation from the Dallas County total, from -infinity to +infinity. That deviation is the mortality deviation for the chart. Because heart disease and cancer predominate, this tends to over-weight these two causes compared to the other three (stroke, COPD and diabetes).
- Years of potential life lost. Using the Years of Potential Life Lost Rate per 100,000, calculate for each service area the percent deviation from the Dallas County YPLL rate, from -infinity to +infinity. That deviation is the YPLL deviation for the chart.
- Infant Mortality. Using the Infant mortality rate per 1,000 live births, calculate for each service area the percent deviation from the Dallas County infant mortality rate, from -infinity to +infinity. That deviation is the infant mortality deviation for the chart.
- Very Low Birth Weight. Using the Very Low Birth Weight rate per 1,000 live births, calculate for each service area the percent deviation from the Dallas County VLBW rate, from -infinity to +infinity. That deviation is the VLBW deviation for the chart.
- Morbidity. For each service area and for Dallas County, add the 2009 incidence rates per 100,000 for the four reportable diseases (aseptic
 meningitis, cryptosporidiosis, pertussis, salmonellosis), to get a single number. Calculate for each service area the percent deviation from the
 Dallas County total, from -infinity to +infinity. That deviation is the morbidity deviation for the chart. Meningitis and salmonellosis are more
 common, so this tends to over-weight them, although all are fairly rare in a population sense.
- · Violence and Injury. Three steps:
 - For each service area and for Dallas County, add the 2011 age-adjusted death rates for the injury-related causes of death (motor vehicle crashes, poisoning, falls, suicide and homicide) and the age-specific seniors falls death rate (all of which are in units of deaths per 100,000), to get a single number. Calculate for each service area the percent deviation from the Dallas County total, from -infinity to +infinity.
 - Then using the rate per 100,000 of ED visits for injuries, calculate for each service area the percent deviation from the Dallas County rate, from -infinity to +infinity.
 - Calculate the arithmetic mean of these two percent deviations. That is the Violence and Injury deviation for the chart. This might over-weight ED visits somewhat, but it is qualitatively different from mortality.

Methods of calculating deviations from the Dallas County mean for the preceding chart

- High Risk Sexual Behavior. Three steps:
 - For each service area and for Dallas County, add the 2011 incidence rates for three non-HIV STDs (Chlamydia, gonorrhea and syphilis), to get a single number in units of cases per 100,000. Calculate for each service area the percent deviation from the Dallas County total, from -infinity to +infinity.
 - Then using the rate of new HIV diagnoses per 100,000, calculate for each service area the percent deviation from the Dallas County rate, from -infinity to +infinity.
 - Then using the rate of births to girls 15-17, per population of girls 15-17, calculate for each service area the percent deviation from the Dallas County rate, from infinity to +infinity.
 - Calculate the arithmetic mean of these three percent deviations. That is the High Risk Sexual Behavior deviation for the chart. This might under-weight syphilis somewhat. Each category is given an the equal statistical weight (STDs, HIV and teen births), since they are qualitatively quite different we probably can't resolve that to everyone's satisfaction.
- Access to Clinical Care. For each service area and for Dallas County, add the 2011 percent of people without health insurance and
 rate of non-emergent ED user per 1000 population, then subtract the rate of primary care physicians per 100,000 population (since
 higher is better for this measure), to get a single number. Calculate for each service area the percent deviation of this total from
 the Dallas County total, from -infinity to +infinity. That deviation is the access to care deviation for the chart. Although these three
 measures are in different units, the values were in the range of 5-130 (in different units), such that the contributions of each of the
 three measures to the total was approximately equal.
- Quality of Clinical Care. There are 12 preventable hospitalization discharge rates for each service area, age-adjusted in units of discharges per 100,000. Some are more common, such as bacterial pneumonia (in the range of 100-400 discharges per 100,000), while some are more rare (around 5-10 per 100,000). So for each service area and for Dallas County, for each discharge category calculate the percent deviation from the Dallas County rate. Calculate the arithmetic average of these 12 deviations, that deviation is the quality of care deviation for the chart.
- Socioeconomic indicators. There are four socioeconomic indicators—percent age 65 or older, percent age birth to 14, percent of
 adults age 25+ without a high school diploma, percent of the population below the federal poverty limit. For each service area and
 for Dallas County, for each of these four indicators calculate the percent deviation from the Dallas County rate. Calculate the
 arithmetic average of these four deviations, that deviation is the socioeconomic deviation for the chart.

Age Adjusted Death Rates: Death rates that control for the effects in population age distributions. The centers for Disease Control and Prevention established the standard population weights for direct age adjustments. The need for age adjustment becomes particularly important when cause-specific mortality is of interest. Unadjusted rates for chronic diseases (cardiovascular diseases, cancers, or chronic lower respiratory diseases) may appear to be higher for older populations when compared to a younger population. With age-adjustment those differences may be reduced or even reversed. A mechanism for adjusting the age structure differences is needed to determine if there really are mortality differences between two populations. By applying age-specific mortality rates to a standard population, direct standardization controls for differences in population composition. Mortality trends can be more accurately compared along geographic, temporal, or race/ethnicity lines, etc. In short, standardization lets us look at what the death rate would be in one population if that population had the same age structure as the standard population. Beginning with 1999 events, the United States year 2000 population is used as the standard for age-adjusting.
